GitHub | LinkedIn | bannusha.com

Summary

Data Engineer for operational data models, pipelines, and the tables a team can query. Fortune 500 intern at SKF: Microsoft 365 (Excel, SharePoint, Forms), Power Apps, Power BI, and daily data-accuracy routines that flag a score against a qualifying bar. Built snapshot pipelines and schema-locked SQL so a number is defended against a baseline, not a raw total. Seeking a Data Engineer role.

Professional Experience

SKF — Data Engineer Intern

May 2026 – Present

Fortune 500 industrial · Bangalore · Microsoft 365, SharePoint, Power Apps, Power BI

- Own the operational data routine on the SKF tenant: replaced paper 5S plant audits with an 11-screen Power Apps and SharePoint system factory teams use for scores, photos, and actions.
- Modeled the grain as one audit across five pillars, with identity-aware, zone-scoped write-back, so every submitted audit is a row plant leads can review.
- Served score-card and compliance-trend views: per-pillar totals, pass/fail against a qualifying bar, and the weakest pillar flagged for leadership.
- Support daily and weekly reporting to plant operations: summarize issues and keep the capture rules aligned so the table stays accurate.

Tata Group (Forage) — GenAI Data Analytics

2024

- Modeled delinquency risk on structured financial datasets and wrote the next action a stakeholder could take. A job simulation.

IEEE Student Branch, PES — Technical Support

Aug 2023 – Sep 2024

- College club role. Supported technical sessions: setup, troubleshooting, and keeping events running.

Key Projects

Creator Lab

Live

know-stats.streamlit.app

- Ingested the YouTube Data API into SQLite for 100 Indian creators and about 3,500 videos. Grain is one snapshot of one video, so views, likes, and comments are a time series rather than a one-time scrape.
- Defined engagement as (likes + comments) / views and outlier as views versus that creator's own median, then shipped a public app that scores a draft and returns a view range plus the nearest videos in the table.

Technologies: Python, SQLite, YouTube Data API, pandas, Streamlit

Bengaluru Civic Warehouse

In progress

Weather, air, and mobility · one city model

- Designing a warehouse for three public city feeds that do not share a schema, a clock, or a location. Each pull lands as an untouched raw payload before any cleaning.
- Invalid rows go to a reject table with the rule that failed. Ward, station, and date are dimensions in PostgreSQL and PostGIS. An unknown location is surrogate key -1, not a dropped row.

Technologies: Python, PostgreSQL, PostGIS

Technical Skills

Data engineering: ETL, data pipelines, data modeling, API ingestion, schema design, snapshot tables, data quality

SQL & databases: SQL, PostgreSQL, MySQL, SQLite, joins, window functions, parameterized queries

Python: Python, pandas, NumPy, API clients, scikit-learn

Tools: Power BI, Streamlit, Grafana, Docker, Git, Power Apps, SharePoint

Education

B.Tech, Artificial Intelligence & Machine Learning

2023 – Expected 2027

PES College of Engineering, Bangalore

Certifications

Machine Learning Specialization
